

H3 (memory) -- INT8 halves cache, but cache is not the dominant term

(a) INT8 cache $\approx 0.516\times$ FP16, constant

(b) cache is a $\sim 10\text{--}14\%$ minority of peak

(a) INT8 cache = $(1 + 2/\text{head_dim})/2 = 0.516\times$ FP16 at head_dim 64, exact across every cell. (b) Because cache is a minority of peak, halving it can't move the memory frontier — see Fig. 4.
